

Penetration Test Summary -- Cloudy SaaS Inc

Independent penetration test of Cloudy SaaS Inc's production environment, performed by a third-party security firm. Scope: external network perimeter, primary web application, and API surface.

Findings: 0 critical, 1 high, 3 medium, 5 low/informational. The high-severity finding (a missing rate limit on an authentication endpoint) was remediated within 14 days of disclosure and independently retested as fixed.

Access control testing confirmed: We enforce multi-factor authentication for all employee access to production systems, without exception. MFA is required at both the VPN and SSO layer before any engineer can reach a production credential.

Logging coverage observed during the engagement: Production audit logs are retained for 30 days in hot storage before rolling off to cold archive.

Full findings detail is available on request under NDA; this summary is the version shared with customers for vendor risk review.
